

Save Money

This document explains how to reduce Azure credit usage for the eCOM-AI portfolio deployment.

What is costing money

- Azure AI Search service
- Azure Database for PostgreSQL Flexible Server
- Azure Container App
- Azure Container Registry
- Log Analytics Workspace

Best low-risk way to save money

If you are not actively showing the project, the safest first action is to stop PostgreSQL.

This saves compute cost while keeping your data.

```
az postgres flexible-server stop --resource-group eCom --name ecom-ai-pg-
```

To start it again later:

```
az postgres flexible-server start --resource-group eCom --name ecom-ai-pg-
```

Safe minimal shutdown plan

Use this if you want to save money but keep recovery simple.

1. Stop PostgreSQL

```
az postgres flexible-server stop --resource-group eCom --name ecom-ai-pg-
```

2. Keep the Container App, Registry, and Search service

This keeps your deployment easier to resume later.

Aggressive near-zero-cost shutdown plan

Use this if you want to save as much credit as possible and do not need the app live.

1. Stop PostgreSQL

```
az postgres flexible-server stop --resource-group eCom --name ecom-ai-pg-
```

2. Delete the Container App

```
az containerapp delete --name ecom-ai-ca-zahee01 --resource-group eCom --y
```

3. Delete the Log Analytics Workspace

```
az monitor log-analytics workspace delete --resource-group eCom --workspa
```

4. Delete Azure Container Registry if you do not need fast redeploy

```
az acr delete --name ecomaiacrzahee01 --resource-group eCom --yes
```

Recommended student strategy

For a portfolio project, keep the app down most of the time and start or recreate it only before demos. Keep screenshots and a short demo video so you do not need to keep Azure resources running continuously.

Suggested action right now

```
az postgres flexible-server stop --resource-group eCom --name ecom-ai-pg-
```
